RanLin Farm

Ohio, USA

About RanLin Farm

Ohio Hemp™ is a premier bioscience research station located in Clark County, Ohio (Birthplace of 4-H). We are proud to be officially licensed by the Ohio Department of Agriculture since the inaugural 2020 season, operating under compliance with the rigorous standards of the U.S. Domestic Hemp Production Program. With our extensive expertise in large-scale organic hemp cultivation, we offer valuable advice and consultation to farmers throughout the Ohio Valley region. Our primary mission is to foster a robust network of producers, processors, and related industries. We pride ourselves on engaging in dynamic public-private partnerships, backed by USDA support. As one of Ohio's pioneering and largest hemp companies, we are actively driving the industry forward, particularly in the crucial area of carbon capture.

Project Owner Details

URL in Registry :

ID Number : 0009

Name of Registrant : Trevor Richardson

Email : t.jrich@outlook.com

Contact Person : Trevor Richardson

Location : Ohio

Project Details

Industrial Hemp is not Cannabis and has no drug related properties, it is a completely different plant.

Industrial hemp does however have a major role to play in our fight against global warming as it is an amazing carbon sink and exceptionally versatile in producing sustainable products like Hempcrete and biodegradable plastic substitutes

Project type - Sustainable Agriculture

Credit Type - Carbon Removal

Country - USA

Province - Ohio

Project status - Under verification

Registry - Trusted Carbon

Methodology - Hemp Carbon Standard

Crediting period - 01/05/2023 - 23/10/2023

Expected Volume - 80 tCO₂e

Co-Benefits & SDG's

Co-benefits:

- Regenerative agriculture
- Improved crop yields from soil remediation
- Storage of CO₂ in soil
- Elimination of the use of fossil-based fertilisers.
- Soil decontamination and absorption of pollutants
- Sustainable end-product use
- Creation of green jobs
- Expanding Biodiversity

Project SDG's

Economic Acceleration Impact

The income earned by carbon removal providers fuels their expansion, magnifying their impact on the climate and hastening the transition to a net-negative carbon economy. Moreover, local communities, which rely on the economic prosperity of farmers, benefit through increased job opportunities.

About Trusted Carbon

Our Purpose:

Trusted Carbon was founded with a singular vision: to elevate the standards of determining CO2 claims tied to carbon credits. In a world facing the pressing challenges of climate change, we understand the imperative nature of ensuring accurate and trustworthy carbon credit attributions.

Our Solution:

At Trusted Carbon, we've pioneered cutting-edge methodologies that harness the power of advanced technology. This allows us to achieve a heightened level of precision that businesses can trust.

Strict Validation:

Offering the utmost trust and credibility is paramount to our operations. We have meticulously crafted a strict validation process for adding methodologies to our registry. This ensures that every method we endorse aligns seamlessly with the rigorous standards set by the International Council for the Voluntary Carbon Market (ICVCM).

Quantification Methodology

CO2 Quantification Methodology for ISO Verification of the Hemp Carbon Standard

The CO2 quantification methodology for ISO verification of the Hemp Carbon Standard aims to establish a rigorous and transparent process for determining the net sequestration of CO2 during the growth cycle of industrial hemp crops. This methodology utilizes an MRV (Monitoring, Reporting, and Verification) system that combines Eddy Covariance Flux Towers, Sentinel satellite data, and a machine learning algorithm to accurately quantify the CO2 sequestration potential of hemp crops. The methodology ensures consistency, accuracy, and reliability in measuring and reporting carbon sequestration, providing a reliable basis for ISO verification.

Eddy Covariance Flux Towers & Sentinel Satellite Data:

Continuously record CO2 flux data using the Eddy Covariance Flux Towers throughout the hemp crop growth cycle.

Obtain satellite imagery data from the European Space Agency's Sentinel program, specifically Sentinel-2 for high- resolution optical data and Sentinel-1 for synthetic aperture radar (SAR) data.

Pre-process the satellite data by removing atmospheric effects, geometric corrections, and radiometric calibrations.

Project Lifecycle

Validation

Control Union Certifications focuses on sustainable agriculture supply chains for food, feed, forestry, biomass, bioenergy, social compliance, and textiles. With a presence in 80+ countries, we manage global marketplace challenges.
